## Variable steering concept with "active rear-axle steering"

Axles 3, 4 and 5 set up as "active rear-axle steering, 6 steering methods are preselectable by fixed programs (P):

### P1 On-road steering

Axles 1 and 2 are steered mechanically with hydraulic assistance by the steering wheel. Axles 3, 4 and 5 are steered "actively" speed-dependent according to the cramp of the front axles, and over 30 km/h, axles 3 and 4 are set to straight displacement and fixed, from 60 km/h, axle 5 is fixed equally to straight displacement. The change of the steering angle in accordance with the speed, results in a precise and stable driving quality during higher speeds, tyre abrasion is reduced and the maneuverability clearly improved.

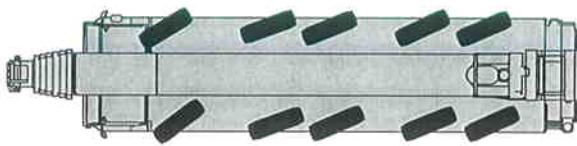

### P2 All-wheel steering

Axles 3, 4 and 5, dependent on the steering angle of axle 1 are cramped by means of the steering wheel so that the smallest turning radii can be performed.

### P3 Crab steering

Axles 3, 4 and 5 are cramped into the same direction as axles 1 and 2 by means of the steering wheel.

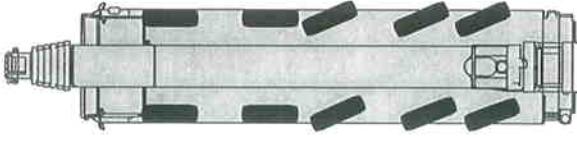

### P4 Steering without swerving

Axles 3, 4 and 5 are cramped in accordance with axle 1 so that no swerve out of the rear of the carrier takes place.

### P5 Independent rear-axle steering

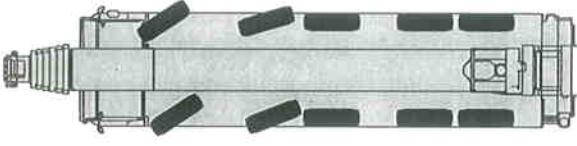

Axles 1 and 2 are cramped by the steering wheel, axles 3, 4 and 5 steered independent of the cramp of axles 1 and 2 by momentary-contact buttons, whereby the cramp of axle 3 is adapted to the required situation.

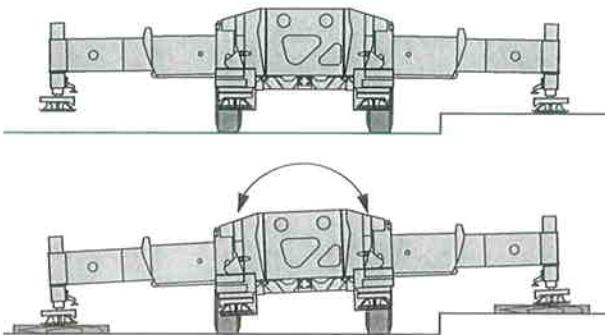

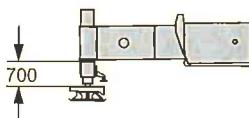

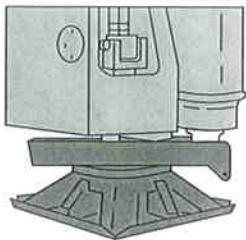

### P6 Rear-axle steering locked

Axles 3, 4 and 5 are not steerable.

- A failure in the rear-axle steering does make it ineffective and the rear axles are set to straight displacement by the centering rams
- Two independent hydraulic circuits with wheel- and engine driven hydraulic pump, thus maximum safety standard
- Two independent control processors (by existing E/A modules) and diversified sensoriel system
- Entire know-how of the "active rear-axle steering" by Liebherr

## The LICCON work area limitation system

- It relieves the crane operator, especially in situations where the handling of loads requires his full attention, by controlling the work area limits. Work areas can be restricted by buildings, bridges, roofs, high-tension power lines, pipe lines or adjacent cranes. The automatic work area limitation system (optional), can easily be programmed. Four different limitation functions are practicable:
  - Height limitation of the pulley head
  - Radius limitation
  - Slewing angle limitation
  - Limitation of edges

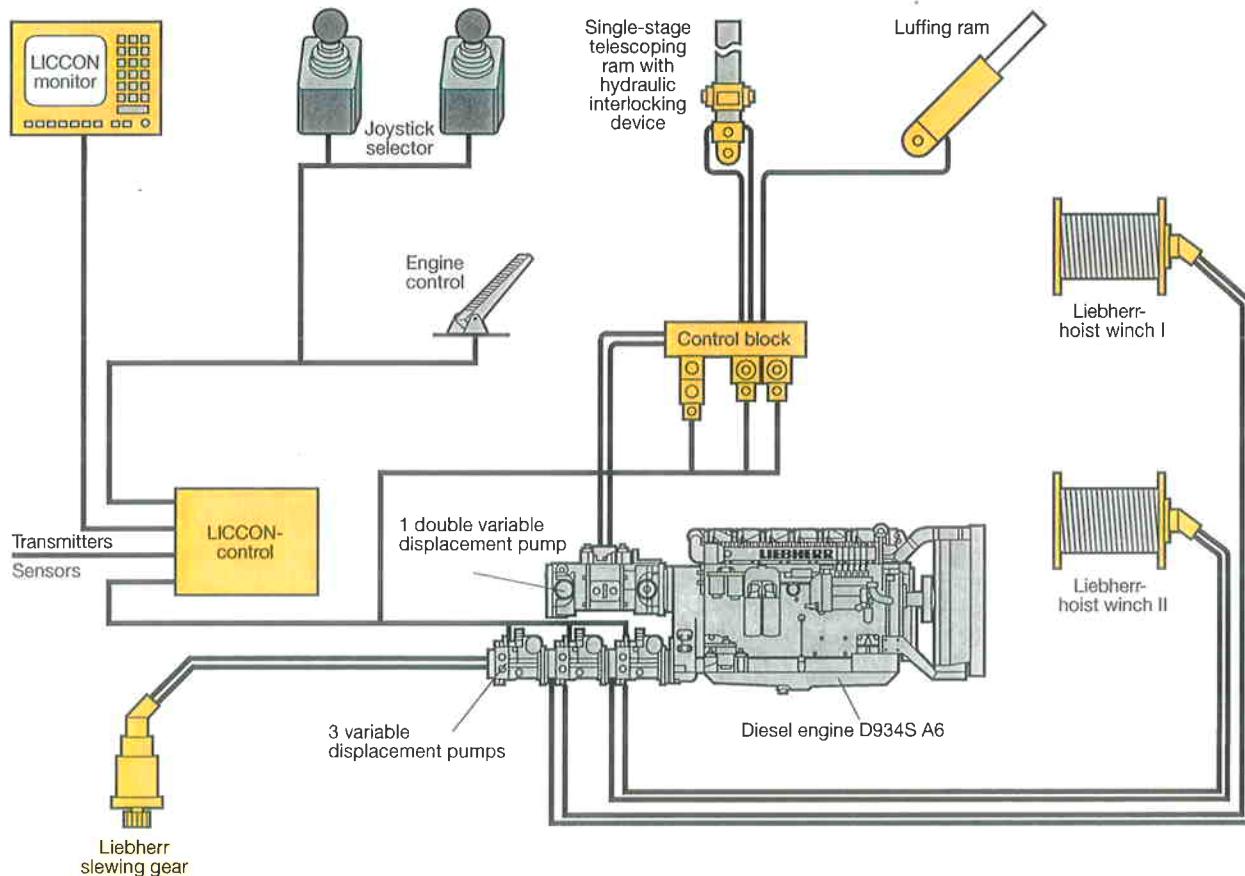

## The LICCON work planner

- The LICCON work planner consists of a software program on CD for planning, simulation and documentation of crane applications on the display screen (optional)
- The 2D planner program enables the drawing of buildings, to write texts and to represent a crane model true to scale including the entire motions within a fictional construction site
- The work planner permits the preparation of more transparent offers, facilitates the briefing of crane operators and can be run on a Laptop at the construction site

## Electric/electronic PLC crane control with test system

- Control of the winches, slewing gear and the luffing and telescoping motions by the LICCON computer system (PLC control)
- Four working motions can be performed independent from one another
- Speeds for lifting/lowering, luffing and slewing preselectable by 5 steps
- Very short response rates at the activation of crane motions
- Hoist gear and slewing gear are operating within a "closed oil circuit". This enables very sensitive lifting/lowering of loads, or slewing. Moreover, during lowering of the load, the generated potential energy is not converted into heat but can be re-employed, for a 2nd motion. This saves fuel and the oil is less thermically exposed than by operation within the open circuit.
- Functional test of all essential components by means of the LICCON test system
